#### (54) Title: TRICK PLAY SIGNAL GENERATION FOR A DIGITAL VIDEO RECORDER

#### (57) Abstract

The invention relates to the generation of a trick play information stream from a normal play information stream, so that they can be recorded together as a composite information stream on the record carrier, such that upon reproduction in a trick play reproduction mode, an information signal of sufficient quality, e.g. as regards visibility, can be obtained. One aspect of the invention lies in the generation of GOPs, GOP comprising an I-frame retrieved from the original information normal play stream, and one or more so-called "empty P frames". Another aspect of the invention is the requirement of generating GOPs for the trick play information stream that have a constant bitcost Trick play speed + 4 PP P Р Time Trick play speed + 12 I P P P I P P I Ι P IPP Time Trick play speed + 24 P Ρ P Time

per GOP. Again another aspect of the invention lies in the retrieval of the I-frame for the trick play information stream from the normal play information. More specifically, an I-frame is generated by retrieving from an I-frame included in the normal play information, the DC coefficient of the I-frame and a number of AC coefficients from that I-frame and generate the I-frame for the trick play information stream therefrom. More specifically, the number of AC coefficients for an I-frame of the trick play information signal depends on the difference between the DC coefficients of two subsequent I-frames in the normal play information from which the I-frame to be generated and the just previously generated I-frame for the trick play information signal have been derived.

International application No. PCT/IB99/01015

Box I	Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
This intern	ational search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
1.	Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
السا	Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
Box II	Observations where unity of invention is lacking (Continuation of item 2 of first sheet)
	national Searching Authority found multiple inventions in this international application, as follows:
2. 🖂	As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4.	No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
Remark	on Protest  The additional search fees were accompanied by the applicant's protest.  No protest accompanied the payment of additional search fees.

Form PCT/ISA/210 (continuation of first sheet (1)) (July1992)

International application No. PCT/IB99/01015

WO 9613121 discloses a method of recording digital video information comprising merging means adapted to merge intra encoded pictures extracted from a digital video information signal with empty inter encoded pictures in order to form a trick play signal. WO 9613121 discloses the technical features of the invention as expressed in claims 1-2. These technical features are the only common features between the inventions 1-3 as stated below. Accordingly, claims 3, 6, 7 do not satisfy the requirement of unity of invention.

Invention 1 - Claims 3-5, 13, 21, 23 relate to trick play signals in a digital video information recording apparatus. The special technical feature of invention 1 is that a second trick play signal for faster reproduction speed can be generated by selecting group of pictures from the first trick play signal.

Invention 2 - Claims 6 relates to the bit cost of the groups of pictures of the trick play signal. The special technical feature of invention 2 is that these groups of pictures are generated with a constant bit cost.

Invention 3 - Claims 7-12, 14-20, 22 relate to compression of the intra encoded pictures of the trick play signal. The special technical feature of invention 3 is that the intra encoded pictures of the trick play signal are compressed versions of the intra encoded pictures of the digital video information signal.
